1. Introduction

This report provides the analytical results from Sitewide sampling of groundwater and surface water at the ATI Millersburg (ATI), Albany, Oregon, facility (Site) (see Figure 1). The U.S. Environmental Protection Agency (EPA) approved the *Sitewide Groundwater and Surface Water Sampling and Analysis Plan, Revision 2* (SAP; ATI, 2016) on March 10, 2016. The sampling began in April and concluded in July 2016, and included 155 sampling points in the Site's monitoring wells, extraction wells, and surface water.

This revised report addresses EPA comments (November 2, 2017) to the report submitted March 31, 2017 (GSI, 2017). The 2017 report included appendices that provided tables of the complete analytical data from the sampling event. It included a 52 page results section providing data analysis in which concentrations for each analyte in each area of the facility were compared to the appropriate cleanup values, method reporting limits, numbers of detections, and the concentration ranges for all the detections.

This revised report includes more discussion of the results and electronic versions of the report include copies of all the laboratory data packages for the sampling event as requested by EPA. Groundwater data collected in the fall of 2016 that is not part of this sampling event is included in the annual remedial progress summary reports for 2017.

2. Sample Locations

Sitewide sampling locations and analyses were completed according to the SAP (see Table 1). Sample bottles were filled for seven types of analyses: volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), total and dissolved metals, general chemistry, radium-226/228, and polychlorinated biphenyls (PCBs). These samples were spread across five areas of the Site:

- Solids Area – 17 wells (Figure 2a)
- Farm Ponds Area – 32 wells (Figure 2b)
- Extraction Area – 25 wells (Figure 2c)
- Fabrication Area – 76 wells (Figure 2d)
- Surface Water – 5 creek locations in Murder Creek and Truax Creek (Figure 2e)

Many of the wells sampled during the remedial design work (*Remedial Design/Remedial Action Sitewide Work Plan*, CH2M-Hill, 1997) had not been sampled in many years. The sampling period was extended for a small sub-set of wells that could not be located, primarily because of the growth of blackberry vines and other occluding vegetation. A surveyor worked in conjunction with a landscape crew to locate the missing wells. One well, MW-11A in the East Perimeter Area, was found to have been damaged during historical construction activities at the Site. A driller was employed to reconstruct the surface monument and the well was successfully sampled. Eventually, every well listed in Table 1 was located and sampled. MW-09A, in the Fabrication Area, was completely dry for sampling. Several wells, such as PW-09, PW-104S, PW-107S and others did not have enough water to fill all of the sample jars, even with multiple trips to the well, and these omissions are footnoted in the complete analytical tables that comprise the appendices of this report. The radium-226/228 analysis, for example, requires the

filling of a 4-liter cube-container and this could not completed within the holding time requirements at a few of the poorer producing wells.

3. Sample Collection Procedures

3.1 Procedures

The samples were collected according to the guidelines provided in Section 4.1 of the SAP. An initial depth-to-water measurement was made after removing the well cap and allowing the well to vent. New, dedicated sample tubing was used in all wells. A Geopump II peristaltic pump was used in conjunction with a YSI multiparameter instrument, which was calibrated daily using fresh calibration standards and a flow-through cell to limit the interference of air. Water was purged until parameters were stable and drawdown was controlled following the U.S. Environmental Protection Agency's (EPA) *Low-Flow (minimal Drawdown) Groundwater Sampling Procedures* (Puls and Barcelona, 1996).

3.2 Water Levels

Groundwater elevations recorded during sampling are presented in Table 2. Because of the large number of wells to be sampled, the water level measurements were recorded over a long period of time and proved not to be suitable for water level contouring. Groundwater flow direction may be found more accurately by examining the most recent remedial progress summary for each particular area of the Site.

Annual remedial action progress summaries provide the most accurate information for waterlevel contouring because the measurements are synoptic for relevant groupings. In 2017 the static water level measurements were collected on a single day in the Solids Area, the Farm Ponds, and the Extraction Area. In the Fabrication Area the static water levels were collected synoptically in relevant groups over a four day period. Synoptic groundwater contouring for all areas of the facility will be provided in the 2017 progress summary due to EPA February 28, 2018.

3.3 Water Quality Parameters

Water quality parameters recorded after stabilization are presented in Table 3. Results are grouped by each of the main areas of the Site and include pH, specific conductivity, dissolved oxygen, oxidation-reduction potential, and temperature.

4. Quality Control Program

The Sitewide monitoring was completed in conformance with the Sitewide quality assurance project plan (QAPP) and the provisions of the SAP for the project. Duplicate samples for field quality control were collected at a frequency of 5 percent of the samples collected during the event. All duplicate samples were collected at the same time as the parent sample and blind-

labeled and delivered to the laboratory (Applied Sciences laboratory [ASL] in Corvallis, Oregon) with the normal shipment. Matrix spike and matrix spike duplicate samples also were collected at a frequency of 5 percent and when potential changes in the sample matrix were anticipated because of previous sampling results. ASL provided the use of approved analytical methods according to the QAPP, analytical data package deliverables, and conformance with the laboratory's quality assurance manual.

All samples were immediately placed in iced coolers and maintained under chain-of-custody protocols. ATI personnel delivered samples daily to ASL during collection periods.

Field and laboratory data were subjected to a formal verification and validation process in accordance with EPA guidance documents as described in the QAPP. An external party, as defined in EPA's *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use* (EPA, 2009) QA/QC Solutions, LLC performed the data validation to determine the usability of the data for meeting project objectives. An abbreviated validation review (i.e., a summary review of the results reported) was performed on 90% the data and a more comprehensive validation review was performed on 10% of the data as described in section D.1 of the QAPP.

Data qualifiers were assigned during data validation to the electronic data deliverables (EDD) when applicable QA/QC limits were not met and the qualification was warranted following guidance specified by EPA (2002, 2005, 2008, and 2010), QC requirements specified in the QAPP, and method-specific QC requirements, as applicable. Final, qualified (as necessary) laboratory results were transmitted in EDDs for data management, further evaluation, and reporting.

After verification and validation of the field and laboratory data as described above data completeness was calculated by comparing the total number of acceptable data (non-rejected data) to the total number of data points generated. Overall, completeness for the Sitewide sampling dataset was 100 percent (i.e., no data were rejected). Only three groundwater samples could not be collected from those listed in Table 1 of the Sitewide SAP; combined radium 226/228 at TMW-5 and PW-09A and SVOCs at PW-09A. The radium sample container requires 4 liters of water that neither of these two wells is capable of producing within the method hold time. TMW-5 recharges at a rate of approximately 200 ml a week and the unpurged well casing volume at PW-09A is typically less than 0.04 gallons. Two samples were collected for combined radium-226 and radium-228 that were not included in Table 1.

5. Analytical Results

5.1 Data Presentation

The sample locations and analyses are presented in Table 1. The individual analyses are further divided into many analytical compounds. Each compound is listed in Tables 3, 4, 5, and 6 of the SAP.

Analytical data from the Sitewide sampling event in this report are presented in two ways:

1. This section of the report (Section 5) provides a comprehensive summary, organized by Site area, compound class, and compound for every analytical compound that has a cleanup standard in Table B-4 of the Sitewide QAPP.
2. The appendices (A through E), again organized by Site area and compound class, present the complete analytical data for all compounds whether there is or is not an applicable cleanup standard.

In the sections below, information is provided about each compound in comparison to other data collected for that compound in the same area of the Site. For example, information about vinyl chloride (VC) results from the Farm Ponds Area is easy to find in the VOC section of the Farm Ponds Area results on page 17 (see Table 4). The VC summary, and all compound summaries include the following information:

- **How many wells are in the area?** (32 in the Farm Ponds Area)
- **What is the VC cleanup standard in the Farm Ponds Area?** (2 micrograms per liter [$\mu\text{g}/\text{L}$])
- **How many VC detections are above the cleanup standard in the Farm Ponds Area?** (zero of 32)
- **How many VC detections are below the ROD?** (3)
 - **How many of the detections are J-flagged estimates?** (2)
- **In how many locations was VC not detected?** (29 of 32)
 - **What is the method reporting limit for VC?** (0.5)
- **What is the VC concentration range in the Farm Ponds Area?** (0.55 $\mu\text{g}/\text{L}$ to 0.5 U)
- **Where can the complete VC analytical data be found?** (Table B-4 in Appendix B)

Data summaries presented below are grouped by Site area in the following order:

1. Solids Area
2. Farm Ponds Area
3. Extraction Area
4. Fabrication Area
5. Surface Water

Within each Site area, the data are consistently presented in the following order:

1. Total Metals 13 compounds
2. Dissolved Metals 10 compounds
3. General Chemistry 3 compounds
4. VOCs 19 compounds
5. SVOCs 6 compounds
6. Combined radium-226/228
7. PCBs Farm Ponds Area and Fabrication Area only

The organization of the data presentation described above also can be found in the Table of Contents, Table 4 of this report, and on the cover sheet that is the first page of each appendix.

At EPA's request Figures 3 and 4 show the spatial distribution of 1,1-dichloroethene (DCE) and VC at the facility. Because there were no cleanup level exceedances for these compounds in the Solids Area or the Farm Ponds Area it was possible to keep the scale focused on the main plant and the Fabrication Area. There was one detection for VC in the Extraction Area at PW-22A ($34.5 \mu\text{g/L}$) and this is shown in Figure 4. This detection was unanticipated and the well will be resampled in April 2017 to confirm concentrations at the well.

5.2 Preliminary Findings

The monitoring well network performed as designed throughout the Sitewide sampling with few issues that were not able to be immediately resolved through survey work, vegetation clearing, or well maintenance. Since the Sitewide sampling event, Fabrication Area wells TMW-1 and TMW-4 have been removed as part of the source area removal project in the Acid Sump Area. These wells have been substituted with monitoring wells I-2, I-3, and EI-5. The replacement wells were sampled in the fall 2016 event and will be reported in the next annual progress summary for the Fabrication Area. Monitoring well MW-09A, which was dry for sampling during the Sitewide event, will be assessed for damage and repaired if necessary as it is not clear why this well was dry.

There were no cleanup standard exceedances in the perimeter wells with the exception of PW-22A in the Extraction Area and PW-15AR in the Fabrication Area. Both of these wells will be resampled in April 2017 to confirm concentrations observed in the Sitewide event. ATI will forward analytical results to EPA as soon as they become available so the agency will not have to wait for the next progress summaries from these two areas.

At EPA request this report includes two figures showing the sitewide distribution of 1,1-dichloroethene (Figure 3) and vinyl chloride (Figure 4). These concentration isopleths involve some measure of interpretation and the concentration borders could be dashed to reflect the uncertainty, as in groundwater contouring. In Figure 3, for example, MW-01A has a DCE concentration of $25.3 \mu\text{g/L}$ while approximately 70 feet to the southeast DCE is not detected in MW-11A. Exactly where the concentration of DCE drops to below $7 \mu\text{g/L}$, the ROD standard for DCE, is unknown. The line position is informed, however, by examining the attenuation distance of DCE at other well locations and well-pairs throughout the site. The 2017 annual progress summaries provide additional information to assist in assessing the concentration distributions shown in these two figures.

In 2015, ATI installed additional wells (PW-105S, PW-106S, and PW-107S) in the Farm Ponds Area to assess the potential distribution of VOCs from former well SS, which was replaced by PW-104S. There were detections for VOCs in PW-104S, but none of those detections were observed in the new downgradient wells with the exception of a J-flagged estimated detection for 1,2-dichloroethane in PW-105S ($0.23 \mu\text{g/L}$ J). There does not appear to be a downgradient VOC plume from the former well SS location in the Farm Ponds Area. A more detailed discussion of this conclusion is included in the 2017 progress summary for the Farm Ponds, which includes the most recent analytical data and synoptic groundwater contouring.

Analytical results for manganese in all areas have been highlighted in the data tables as exceedance of the cleanup standard. However, the cleanup level is a secondary maximum contaminant level, which is a guidance for aesthetic purposes and does not pose a risk.

Surface water sampling in Murder Creek and Truax Creek had no cleanup level exceedances with the exception of iron at sample points MC-U (1,120 µg/L) and MC-D (1,500 µg/L). The iron concentration at MC-U represents the background conditions in the creek before it flows adjacent to the facility. Cleanup levels for total and dissolved concentrations for cadmium, copper, lead, mercury, and zinc are function-based values using sample-specific calculations according to Table 30: *Aquatic Life Water Quality Criteria for Toxic Pollutants* (DEQ, 2016). The specific function based values are included in Tables E-1 and E-2. The surface water sampling results show there is no risk from offsite exposure in the adjacent creeks.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

2 Insufficient volume for sample collection.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

 = detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup level is a combined concentration of radium-226 and radium-228.

2 Insufficient volume for sample collection.

J = estimated value below the reporting limit.

pCi/L = picocurie per liter.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

PCBs = polychlorinated biphenyls

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1. Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

 = detected value exceeds cleanup level.

Notes:

1 Cleanup level is a combined concentration of radium-226 and radium-228.

pCi/L = picocurie per liter.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

2 Insufficient volume for sample collection.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

2 Insufficient volume for sample collection.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

mg/L = milligram per liter.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.

Notes:

1 Cleanup levels are derived from multiple sources; see Table B-4 of the Quality Assurance Project Plan (Sitewide QAPP) for details.

µg/L = microgram per liter.

J = estimated value below the reporting limit.

U = analyte was not detected above the reporting limit.

= detected value exceeds cleanup level.
